Intrahost polymorphism in the FCoV spike, measured within each of 10 animals

intrahost variant (one position in one animal) · all positions (error floor) · > 50%: reference mismatch, not intrahost · furin cleavage site

A intrahost frequency of every position, computed separately within each animal — each point is one position in one animal

B the same values, one row per animal — white: covered, no intrahost variant · grey: coverage too low to judge

C how many of the 10 animals carry an intrahost variant in each 3-codon window (pale bar = animals with usable coverage there)
